

Overhead Sprinklers

Overhead sprinklers are commonly used in irrigating flowers, nurseries and propagation sheds. When designing a system to irrigate your Greenhouse with overhead sprinklers, it is our goal to achieve a system that provides uniform irrigation.

One of the benefits to using this method of irrigation, is instead of hand watering bedding plants, seedlings, and potted perennials; you reduce labour costs and improve efficiency and plant quality when the system is designed and installed correctly.

When designing your next system it is important to remember the sizing of pipes, pumps, and valves is paramount to ensuring you get an adequate and even amount of water to all of your plants. Depending on the size of the crop, the irrigation cycle could be simple, or it could progress through a series of zones controlled by automated solenoid valves.
